## Abstract

This paper presents a fuzzy approach of LR types, also called LR-type tabular fuzzy arithmetic capable of handling or computing simultaneously the kernels and supports of trapezoidal fuzzy numbers, instead of doing it separately (Advantage of this approach) in order to minimize the tedious steps of alpha-cut based approaches. On the theoretical level, the aim of this article is to explain in a concise and clear manner some basic concepts of fuzzy logic that seem to continue to complicate authors and readers (researchers) in this field, given the important place of this theory in Artificial Intelligence today. Some user interfaces have been created in this article, with the python language, in order to automatically calculate certain results; and especially to minimize the calculation time, in particular of membership degrees, kernels and supports. Trapezoidal fuzzy numbers are transformed into LR form in order to allow a comparative study between the alpha-cut approach with the Jomatopfe LR-type tabular fuzzy arithmetic presented in this paper. We successfully demonstrated the transition from the trapezoidal fuzzy form to the LR type form and vice versa. After a comparative study between the alpha-cut approach and the tabular fuzzy arithmetic of the LR type, Jomatopfe's LR type arithmetic significantly reduced the complexity of the calculation processes compared to classical methods, which require distinct steps for each element. This fuzzy tabular arithmetry is not to be confused with other fuzzy tables operations on membership degrees.

*Keywords: Fuzzy tabular arithmetic; membership function; trapezoidal fuzzy number and alpha-cut.*

## 1 Introduction

This paper is not the first to address the issue of fuzzy arithmetic in fuzzy subset theory.

The literature informs us, for several decades and through numerous works in fuzzy environment, that fuzzy arithmetic based on alpha-cuts and intervals have been applied in several models using the theory of uncertainty to gradually capture alpha-cuts and modal values. These fuzzy arithmetics have been developed in the following way:

- In 1965 the theory of fuzzy subsets by Lofti Zadeh,
- GD (left-right) fuzzy number arithmetic based on kernel and support by Dubois and Prade,
- Fuzzy arithmetic decomposed by Kaufmann and Gupta (early 90s) to present the nuance between fuzzy arithmetic and interval arithmetic with the aim of representing a fuzzy number by its different alpha-cuts as intervals whose membership degree is greater than alpha (fixed level) (Kaufmann and Gupta, 1988) and (Kaufmann and Gupta, 1991)
- Fuzzy arithmetic of alpha-cuts and intervals by Jean Christophe Buisson (2004).
- The arithmetic of discretized fuzzy numbers by M. Hanss (2005),
- Fuzzy arithmetic of alpha-cuts and intervals by Jean pierre Mukeba (2018).

Of all the fuzzy arithmetics mentioned above, we note, unfortunately, that these fuzzy approaches require very heavy calculations to have the kernels and supports of the fuzzy numbers. Beyond this problem, these arithmetics only calculate, separately, the kernels with the kernels, then the supports between them; and finally it is necessary to recompose the kernels with the supports of the results in order to have a single complete fuzzy number. This is a tedious process with several steps.

How can we build a flexible fuzzy approach capable of simultaneously calculating the kernels and supports of fuzzy numbers, in order to reduce the computation time?

Hence the importance of this work.

## 2 Elements of Fuzzy Logic (Dubois and Prade, 1978, Gradi Kamingu, 2016, Sinzinkayo, 2000, Zadeh, 2018, Pedrycz and Gomaa, 2020, Cox, 2017)

We recall that the theory of fuzzy logic has the task of managing fluctuations, uncertainties, imprecisions or ambiguities that taint any linguistic variable defined in an inexact or vague way, in a Universe of discourse X. For example, "a little warmer", "most", "about 7", "high size", "average speed", "about 2 meters".

From this, two main approaches emerge in the theory of fuzzy subsets, namely:

## 2.1 Dubois and prade approach (Dubois and Prade, 1978, Gradi Kamingu, 2016, Sinzinkayo, 2000, Zadeh, 2018, Pedrycz and Gomaa, 2020, Cox, 2017)

Zadeh extension principle with fuzzy operators Min (denoted AND) indicating the intersection and Max (denoted OR) indicating the union of fuzzy subsets.

In practice in artificial intelligence, this approach is based on the degrees and membership function that are most often used in the definition of fuzzy inference systems (FIS) of fuzzy control models or fuzzy command such as that of Mamdani, Sugeno, Takagi, having the following steps:

- Fuzzification
- Evaluation of rules
- Aggregation of rule outputs
- Defuzzification.

Among the fuzzy control models using the fuzzy inference-based approach, it is worth mentioning: NEFCON, PEDRYCZ, ANFIS, Fuzzy SVM, Fuzzy Decision Tree, FCM, etc.

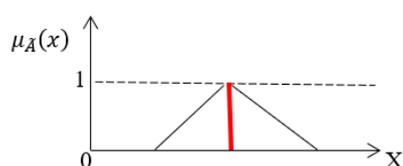

The most commonly used membership functions are as follows and in the following manner:

### 2.1.1 Triangular fuzzy number and membership function (Baali and Mahmoudi, 2022, Cormier, no year, Singhala et al., 2014, Longin, 2016, Wong et al., 2001, Mehran, 2008)

A fuzzy subset  $\tilde{A}$  with membership function  $\mu_{\tilde{A}}(x)$  is called a triangular fuzzy number if there exist three real numbers  $a < b < c$  such that:

$$\mu_{\tilde{A}}(x) = \begin{cases} \frac{x-a}{b-a} & \text{if } a \leq x \leq b \\ \frac{c-x}{c-b} & \text{if } b < x \leq c \\ 0 & \text{elsewhere} \end{cases}$$

Graphically, this is represented as follows:

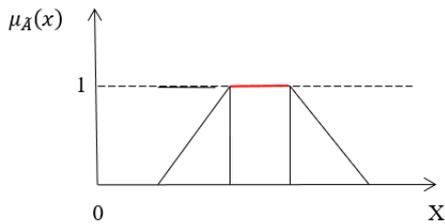

### 2.1.2 Trapezoidal fuzzy number and membership function

A fuzzy subset  $\tilde{A}$  with membership function  $\mu_{\tilde{A}}(x)$  is called a trapezoidal fuzzy number if there exist four real numbers  $a < b < c < d$  such that:

$$\mu_{\tilde{A}}(x) = \begin{cases} \frac{x-a}{b-a} & \text{if } a \leq x \leq b \\ 1 & \text{if } b < x \leq c \\ \frac{d-x}{d-c} & \text{if } c < x \leq d \\ 0 & \text{elsewhere} \end{cases}$$

Graphically, this is represented as follows:

### 2.1.3 Search for membership degrees (Fuzzification)

It consists of assigning to a real number its degree of membership corresponding to a fuzzy subset considered. With the triangular membership function, we can fuzzify the elements of the fuzzy number  $A = (1, 2, 3)$  as follows:

$$\begin{aligned} \text{For } x = 1; \quad \mu_A(1) &= \frac{x-a}{b-a} = \frac{1-1}{2-1} = 0 \\ \text{For } x = 1,5; \quad \mu_A(1,5) &= \frac{x-a}{b-a} = \frac{1,5-1}{2-1} = 0.5 \\ \text{For } x = 2; \quad \mu_A(2) &= \frac{x-a}{b-a} = \frac{2-1}{2-1} = 1 \\ \text{For } x = 2,5; \quad \mu_A(2,5) &= \frac{c-x}{c-b} = \frac{3-2,5}{3-2} = 0.5 \\ \text{For } x = 3; \quad \mu_A(3) &= \frac{c-x}{c-b} = \frac{3-3}{3-2} = 0 \end{aligned}$$

Hence the triangular fuzzy number  $A = (1, 2, 3)$  can be written, after fuzzification, as follows:

$$A = \{1/0; 1.5/0.5; 2/1; 2.5/0.5; 3/0\} \text{ after fuzzification.}$$

To reduce the calculation time, the following interface can be automatically applied:

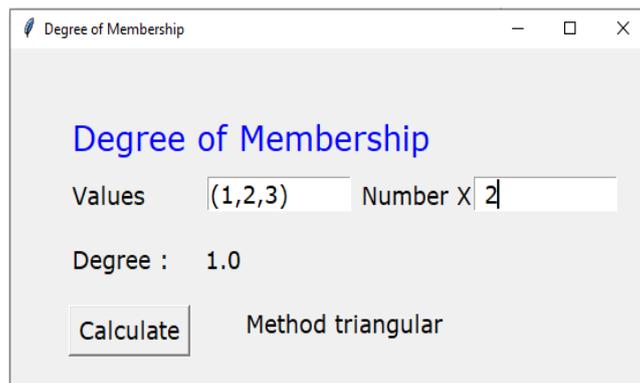

Fig. 1. Calculation of Membership Degree Search (Fuzzification) 1

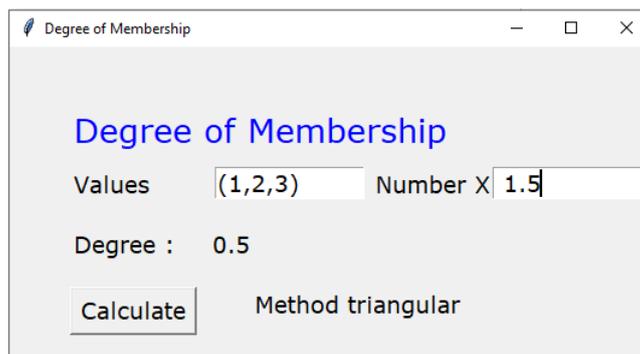

Fig. 2. Calculation of Membership Degree Search (Fuzzification) 2

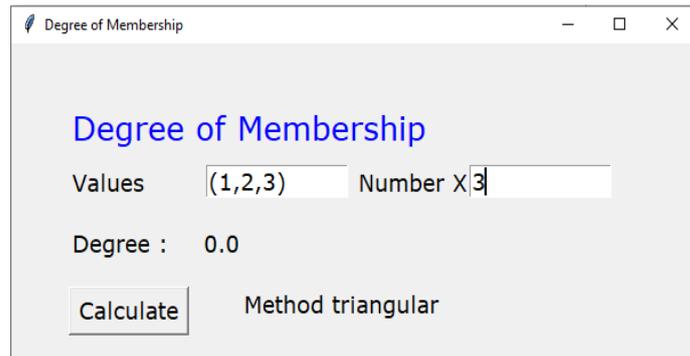

Fig. 3. Calculation of Membership Degree Search (Fuzzification) 3

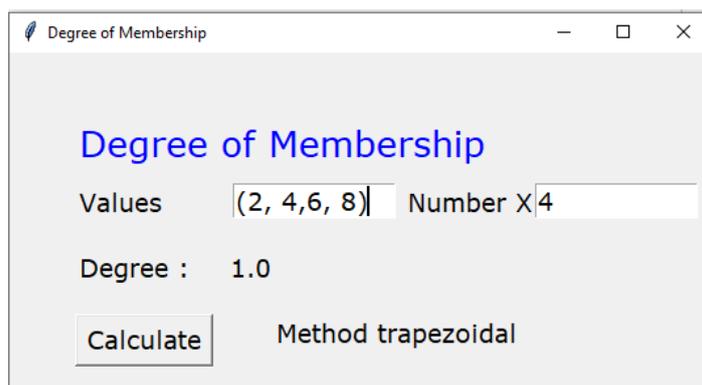

Fig. 4. Calculation of Membership Degree Search (Fuzzification) 4

## 2.2 Approach based on alpha-cuts and intervals (Mazoni et al., 2024, Mazoni et al., no year, Lukezu et al., 2024, Mukeba, 2016)

This approach is applied in the determination or search for the kernels and supports of fuzzy numbers, in order to define the following fuzzy arithmetics:

### 2.2.1 Operations on the $\alpha$ – coupes

and  $\tilde{B} = (a_2, c_2, b_2)$  be  $\tilde{A} = (a_1, c_1, b_1)$  two triangular fuzzy numbers, defined by their  $\alpha$  – coupes respective values:  $\tilde{A} = [a_1, b_1]$  and  $\tilde{B} = [a_2, b_2]$ . We can then perform the following operations:

(i) Addition

$$\tilde{A} \oplus \tilde{B} = [a_1, b_1] \oplus [a_2, b_2] = [a_1 + a_2, b_1 + b_2]$$

(ii) Subtraction

$$\tilde{A} \ominus \tilde{B} = [a_1, b_1] \ominus [a_2, b_2] = [a_1 - b_2, b_1 - a_2]$$

(iii) Multiplication

$$\tilde{A} \otimes \tilde{B} = [a_1, b_1] \otimes [a_2, b_2] = [Min G, Max G]$$

where G is defined by  $G = \{a_1 a_2, a_1 b_2, b_1 a_2, b_1 b_2\}$

(iv) Multiplication by a scalar

Leave  $\lambda \in \mathbb{R}$  and  $\tilde{A} = [a_1, b_1]$

If  $\lambda > 0$ ,  $\lambda \otimes [a_1, b_1] = [\lambda a_1, \lambda b_1]$

If  $\lambda < 0$ ,  $\lambda \otimes [a_1, b_1] = [\lambda b_1, \lambda a_1]$

(v) Division

$$\frac{\tilde{A}}{\tilde{B}} = \frac{[a_1, b_1]}{[a_2, b_2]} = \left[ \text{Min} \left( \frac{a_1}{a_2}, \frac{a_1}{b_2}, \frac{b_1}{a_2}, \frac{b_1}{b_2} \right), \text{Max} \left( \frac{a_1}{a_2}, \frac{a_1}{b_2}, \frac{b_1}{a_2}, \frac{b_1}{b_2} \right) \right], \text{ with } \tilde{B} \neq 0$$

### 2.2.2 Finding the $\alpha$ – coupeskernel and support of a triangular fuzzy number (Mazoni et al., 2024, Mazoni et al., no year, Lukezu et al., 2024, Mukeba, 2016, Albahar et al., 2023, Zhongzhi et al., 2024)

**Definition 2.2.2.1.** Let be  $\tilde{A} = (a, b, c)$  a triangular fuzzy number such that  $a < b < c$ . The  $\alpha$  – coupes are  $\tilde{A}$  defined by the relation:

$$\tilde{A} = [A_{\alpha}^{-}; A_{\alpha}^{+}] = [(b - a)\alpha + a; (b - c)\alpha + c], \quad \alpha \in [0, 1].$$

**Definition 2.2.2.2.** We call the kernel of  $\tilde{A}$  and we denote it by  $N(\tilde{A})$ , the set:

$$N(\tilde{A}) = \{x \in X : \mu_{\tilde{A}}(x) = 1\}$$

**Definition 2.2.2.3.** We call support of  $\tilde{A}$  and we denote by  $supp(\tilde{A})$ , the set:

$$supp(\tilde{A}) = \{x \in X : 0 \leq \mu_{\tilde{A}}(x) \leq 1\}$$

Or  $\mu_{\tilde{A}}(x)$  represents the degree of membership of the  $x$  subset  $\tilde{A}$ .

**Note 2.2.2.4.** In practice, for a triangular fuzzy number  $\tilde{A} = (a, b, c)$ :

(i) if  $\alpha = 0$ , so  $[A_0^{-}, A_0^{+}] = [a, c] = supp(\tilde{A})$ .

(ii) if  $\alpha = 1$ , so  $[A_1^{-}, A_1^{+}] = \{b\} = N(\tilde{A})$ .

### 2.2.3 Finding the $\alpha$ – coupeskernel and support of a trapezoidal fuzzy number

If  $L_{\alpha}^{-}$  and  $L_{\alpha}^{+}$  are the lower and upper limits respectively of the  $\alpha$ – cuts of the trapezoidal fuzzy number  $(b_i - r; b_i; c_i; c_i + t)$ , we will apply the following formula:

$$[L_{\alpha}^{-}; L_{\alpha}^{+}] = [r_i\alpha + (b_i - r_i); -t_i\alpha + (c_i + t_i)], \forall \alpha \in [0, 1]$$

If the fuzzy number is  $A$ , we will directly note:

$$[A_{\alpha}^{-}; A_{\alpha}^{+}] = [r_i\alpha + (b_i - r_i); -t_i\alpha + (c_i + t_i)]$$

#### 2.2.3.1 Numerical example of the LR type

It should be noted that:

$A = (3; 4; 1; 1)$  LR is its LR-like shape and  $A = (2; 3; 4; 5)$  TPZ is its trapezoidal shape

Also,  $B = (5; 7; 2; 2)$  LR is its LR-like shape and  $B = (3; 5; 7; 9)$  TPZ is its trapezoidal shape

For  $A = (2; 3; 4; 5)$ , the  $\alpha$  – cuts are:

$$[A_{\alpha}^{-}; A_{\alpha}^{+}] = [1.\alpha + (3 - 1); -1.\alpha + (4 + 1)], \forall \alpha \in [0, 1]$$

$$[A_{\alpha}^{-}; A_{\alpha}^{+}] = [\alpha + 2; -\alpha + 5]$$

**Core of A** =  $[1 + 2; -1 + 5] = [3; 4]$  with  $\alpha = 1$

**Support of A** =  $[0 + 2; 0 + 5] = [2; 5]$  with  $\alpha = 0$

For  $B = (3, 5, 7, 9)$ , the  $\alpha$  – cuts are:

$$[B_{\alpha}^{-}; B_{\alpha}^{+}] = [2.\alpha + (5 - 2); -2.\alpha + (7 + 2)], \forall \alpha \in [0, 1]$$

$$[ B_{\alpha}^{-} ; B_{\alpha}^{+} ] = [ 2\alpha + 3 ; - 2\alpha + 9 ]$$

**Core of B** = [ 2.1 + 3 ; - 2.1 + 9 ] = [ 5 ; 7 ] with  $\alpha = 1$

**B support** = [ 2.0 + 3 ; -2.0 + 9 ] = [ 3 ; 9 ] with  $\alpha = 0$

Finally, **Core of A + Core of B** = [ 3 ; 4 ] + [ 5 ; 7 ] = [ 8 ; 11 ] the core of the response.

Support of A + **Support of B** = [ 2 ; 5 ] + [ 3 ; 9 ] = [ 5 ; 14 ] the support for the response.

So the final answer is (5; 8; 11; 14)

### 3 Tabular Fuzzy Approach of the LR type

**Matondo's LR-type Fuzzy Tabular Arithmetic Jonathan Opfointshi ENGOMBANGI (JOMATOPFE)**

- *Transition from Trapezoidal Form to LR Type Form*

Let  $A = ( a, b, c, d )$  TPZ, be the trapezoidal fuzzy form of A.

By defining  $r = b - a$  as the left spread relative to the core of A and  $t = d - c$  as the right spread relative to the core of A, the LR type form of A will be denoted as follows:

$$A = ( b, c, r, t ) \text{ LR.}$$

- *Transition from LR Type Form to Trapezoidal Form*

Let  $A = ( b, c, r, t )$  be the LR type form of A.

The trapezoidal form of A will be obtained as follows:

$$A = ( b - r ; b ; c ; c + t ) \text{ TPZ.}$$

Knowing that  $a = b - r$  represents the lower limit of A and  $d = c + t$  represents the upper limit of A, we have:

$$A = ( a, b, c, d ) \text{ TPZ.}$$

Consider  $A = ( a_1 ; b_1 ; r_1 ; t_1 )$  and  $B = ( a_2 ; b_2 ; r_2 ; t_2 )$  two LR trapezoidal fuzzy numbers defined as 4-tuples where  $r_{1,2}$  and  $t_{1,2}$  indicate the left and right deviation respectively, then the results can be summarized in the following tables:

#### 3.1 Fuzzy addition of the LR type

**Table 1. LR type fuzzy addition**

<i>NFTPZ1</i>	$a_1$	$b_1$	$r_1$	$t_1$
<i>NFTPZ2</i>	$a_2$	$b_2$	$r_2$	$t_2$
Result	$a_1 + a_2$	$b_1 + b_2$	$r_1 + r_2$	$t_1 + t_2$

**Example:** Let  $A = ( 3 ; 4 ; 1 ; 1 )$  **LR** and  $B = ( 5 ; 7 ; 2 ; 2 )$  **LR** be two trapezoidal fuzzy numbers of the LR type in 4-tuple form. In the table, we will have:

- Example of fuzzy addition

**Table 2. Example of fuzzy addition**

<i>NFTPZ1</i>	3	4	1	1
<i>NFTPZ2</i>	5	7	2	2
Result	8	11	3	3

Or this result can be written (8, 11, 3, 3) LR

### 3.2 LR type fuzzy subtraction

**Table 3. LR type fuzzy subtraction**

<i>NFTPZ1</i>	$a_1$	$b_1$	$r_1$	$t_1$
<i>NFTPZ2</i>	$a_2$	$b_2$	$r_2$	$t_2$
Result	$a_1 - b_2$	$b_1 - a_2$	$r_1 + t_2$	$t_1 + r_2$

### 3.3 LR type fuzzy multiplication

**Table 4. LR type fuzzy multiplication**

<i>NFTPZ1</i>	$a_1$	$b_1$	$r_1$	$t_1$
<i>NFTPZ2</i>	$a_2$	$b_2$	$r_2$	$t_2$
Result	$a_1 \cdot a_2$	$b_1 \cdot b_2$	$ a_1 r_2 + a_2 r_1 - r_1 r_2 $	$ b_1 t_2 + b_2 t_1 + t_1 t_2 $

### 3.4 LR type fuzzy division

**Table 5. Fuzzy division of LR type**

<i>NFTPZ1</i>	$a_1$	$b_1$	$r_1$	$t_1$
<i>NFTPZ2</i>	$a_2$	$b_2$	$r_2$	$t_2$
Result	$a_1/b_2$	$b_1/a_2$	$(a_1/b_2) - (a_1 - r_1)/(b_2 + b_2)$	$(b_1 + r_1)/(a_2 - r_2) - (b_1/b_2)$

### 3.5 Square of a trapezoidal fuzzy number LR

**Table 6. Square of a trapezoidal fuzzy number LR**

<i>NFTPZ1</i>	$-a_1$	$b_1$	$r_1$	$t_1$
<i>NFTPZ2</i>	$-a_1$	$b_1$	$r_1$	$t_1$
Result	$b_1^2$	$a_1^2$	$ (a_1 - r_1)(b_1 + t_1) - (a_1)^2 $	$ (b_1 + t_1)^2 - (a_1)^2 $

**Table 7. Fuzzy multiplication**

	$a_1$	$b_1$	$r_1$	$t_1$
	$a_1$	$b_1$	$r_1$	$t_1$
Result	$a_1^2$	$b_1^2$	$ (a_1 - r_1)(b_1 + t_1) - (a_1)^2 $	$ (b_1 + t_1)^2 - (a_1)^2 $

To reduce the calculation time, the following interface can be automatically applied:

### 3.6 Automatic calculation interface of the LR type

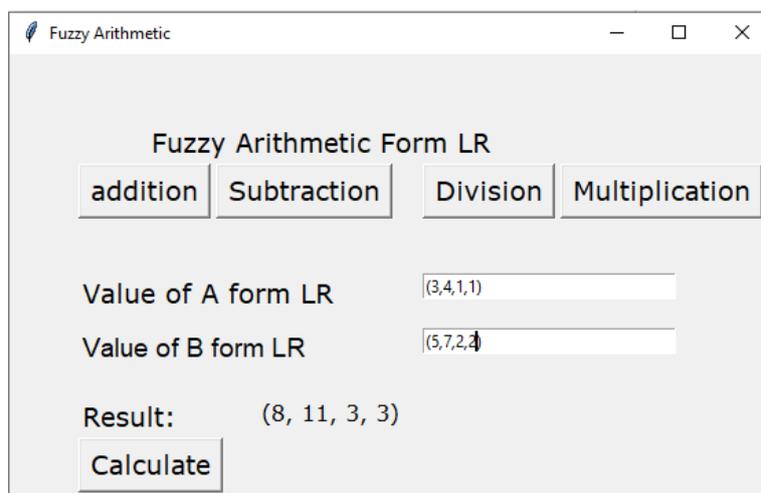

Fig. 5. LR type automatic calculation interface (1)

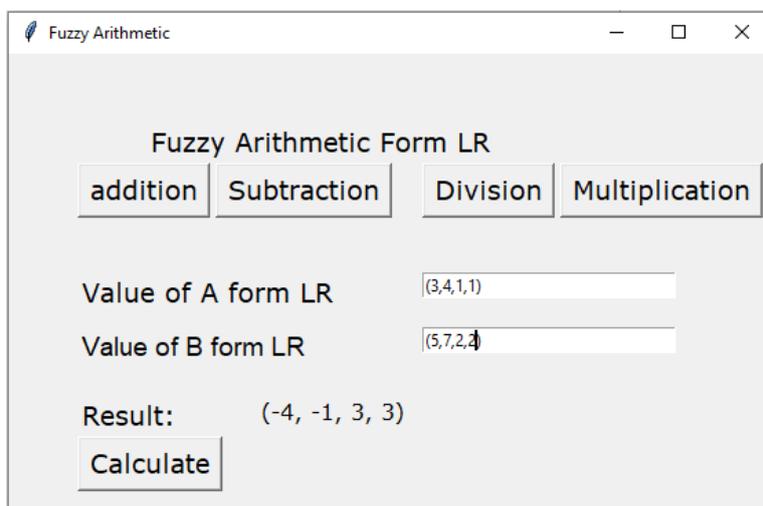

Fig. 6. LR type automatic calculation interface (2)

### 3.7 Comparative study of alpha-cut approaches and LR-type tabular arithmetic

Let us multiply  $A = (2; 3; 4; 5)$  TPZ and  $B = (3; 5; 7; 9)$  TPZ in normal trapezoidal form

#### 3.7.1 Alpha-cut approach

For  $A = (2; 3; 4; 5)$  TPZ, the  $\alpha$ -cuts are:

$$\begin{aligned} [A_{\alpha}^{-}; A_{\alpha}^{+}] &= [1 \cdot \alpha + (3 - 1); -1 \cdot \alpha + (4 + 1)], \forall \alpha \in [0, 1] \\ [A_{\alpha}^{-}; A_{\alpha}^{+}] &= [\alpha + 2; -\alpha + 5] \end{aligned}$$

**Core of A** =  $[1 + 2; -1 + 5] = [3; 4]$  with  $\alpha = 1$

**Support of A** =  $[0 + 2; 0 + 5] = [2; 5]$  with  $\alpha = 0$

For  $B = (3; 5; 7; 9)$  TPZ, the  $\alpha$ -cuts are:

$$[ B_{\alpha}^{-} ; B_{\alpha}^{+} ] = [ 2. \alpha + (5 - 2) ; -2. \alpha + (7 + 2) ] , \forall \alpha \in [0.1]$$

$$[ B_{\alpha}^{-} ; B_{\alpha}^{+} ] = [ 2\alpha + 3 ; - 2\alpha + 9]$$

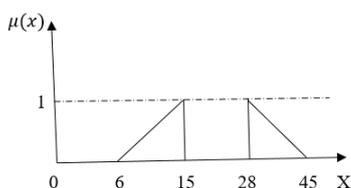

**Core of B** = [ 2.1 + 3 ; - 2.1 + 9] = [ 5 ; 7] with  $\alpha=1$

**B support** = [ 2.0 + 3 ; -2. 0 + 9] = [ 3 ; 9] with  $\alpha=0$

Finally, **Core of A x Core of B** = [ 3 ; 4] x [ 5 ; 7] = [ 15 ; 28] and

**Support of A x Support B** = [ 2 ; 5] x [ 3 ; 9] = [ 6 ; 45]

Graphically we have:

### 3.7.2 Approach to jomatopfe LR-type tabular fuzzy arithmetic

**Table 8. Example of fuzzy multiplication**

HAS	3	4	1	1
B	5	7	2	2
Result	15	28	6+5-2	8+7+2

This result can be written (15; 28; 9; 17) **LR: Form of the LR type** or (15-9; 15; 28; 28+ 17) = (6; 15; 28; 45) **TPZ: Trapezoidal blur shape.**

This result confirms that the two fuzzy approaches thus applied converge

## 4 Conclusion

**Jomatopfe LR** -type tabular fuzzy arithmetic, capable of computing simultaneously the kernels and supports of fuzzy numbers, instead of doing it separately, in order to minimize the tedious steps of the alpha-cut based approaches proposed by other authors.

A comparative study was made through numerical examples in order to show the reduction of calculation times with the new fuzzy approach of the LR type. Jomatopfe.

In this paper, we created some user interfaces to automatically calculate membership degrees and results of LR-type fuzzy tabular arithmetic.

This fuzzy tabular alitmetry is not to be confused with other fuzzy tables operations on membership degrees.
